

XtCreateApplicationContext, XtDestroyApplicationContext, XtWidgetToApplicationContext, XtToolkitInitialize – create, destroy, and obtain an application context

```
XtAppContext XtCreateApplicationContext()  
void XtDestroyApplicationContext(app_context)  
    XtAppContext app_context;  
XtAppContext XtWidgetToApplicationContext(w)  
    Widget w;  
void XtToolkitInitialize()
```

app_context Specifies the application context.

w Specifies the widget .

The **XtCreateApplicationContext** function returns an application context, which is an opaque type. Every application must have at least one application context.

The **XtDestroyApplicationContext** function destroys the specified application context as soon as it is safe to do so. If called from within an event dispatch (for example, a callback procedure), **XtDestroy-ApplicationContext** does not destroy the application context until the dispatch is complete.

The **XtWidgetToApplicationContext** function returns the application context for the specified widget.

XtDisplayInitialize(3Xt)
