

XtBuildEventMask – retrieve a widget’s event mask

EventMask XtBuildEventMask(*w*)
Widget *w*;

w Specifies the widget.

The XtBuildEventMask function returns the event mask representing the logical OR of all event masks for event handlers registered on the widget with **XtAddEventHandler** and all event translations, including accelerators, installed on the widget. This is the same event mask stored into the **XSetWindowAttributes** structure by **XtRealizeWidget** and sent to the server when event handlers and translations are installed or removed on the realized widget.

XtAddEventHandler(3Xt)
